

# **MSiA 400: Everything Starts with Data**

## Project

Team 4: Yuexin Chen, Ziyang Liu, Weiyan Zhou, Ruben Nakano

# Introduction

- Dillard's currently has 282 stores in 29 states
- Managing inventory is always a challenge for large retailers (inventory costs can make up for 20% of a products value)
- A model that can predict products that will need higher discounts based on their characteristics (size, color, brand, etc) would be helpful
  - Opportunity to optimize inventory by not keeping stock of underperforming products
  - Decrease rate of production of underperforming products ahead of time
  - Minimizes potential losses
- Baseline model has an  $R^2$  of 28%, we can do better!

# EDA

- Large amount of items have no discount
- Discounts between 50-55% and 75-80% are the most common
  - Probably because it's uncommon to unrounded values

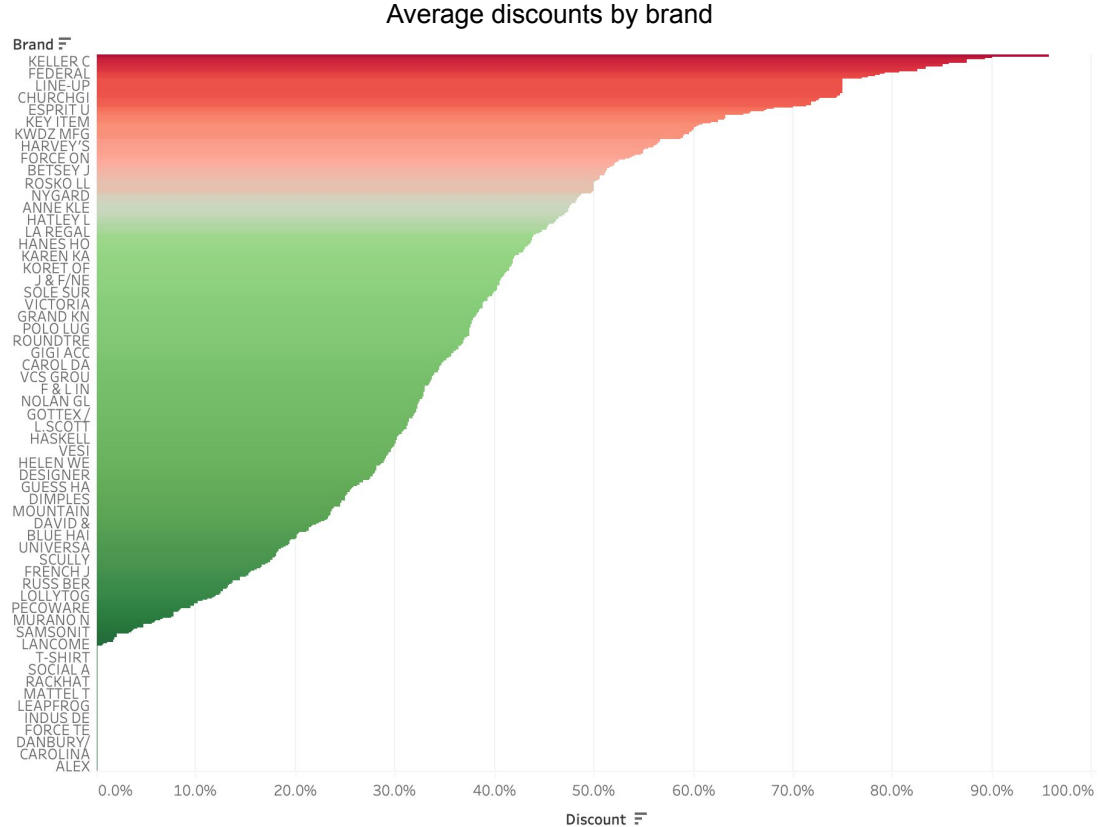

# EDA

- No visible trend in average discounts by color and size
  - Some combinations of color and size are uncommon

| Cleaned Size | New Color |       |       |       |       |       |       |       |       |        |       |        |
|--------------|-----------|-------|-------|-------|-------|-------|-------|-------|-------|--------|-------|--------|
|              | BLACK     | BLUE  | BROWN | GOLD  | GREEN | MULTI | other | PINK  | RED   | SILVER | WHITE | YELLOW |
| ALL          | 31.0%     | 28.9% | 31.1% | 22.8% | 31.9% | 37.1% | 33.3% | 33.6% | 33.1% | 33.6%  | 29.3% | 27.3%  |
| L            | 40.5%     | 37.7% | 32.7% | 39.9% | 36.6% | 41.0% | 37.2% | 37.8% | 37.2% | 30.8%  | 30.0% | 31.4%  |
| M            | 38.9%     | 34.0% | 27.5% | 38.4% | 30.4% | 45.3% | 36.6% | 38.1% | 37.1% | 42.6%  | 32.0% | 39.8%  |

| S            | 41.3%     | 37.9% | 21.6% | 29.3% | 31.4% | 42.6% | 38.1% | 39.0% | 43.1% | 0.0%   | 30.5% | 42.9%  |
| XL           | 37.4%     | 32.1% | 31.0% | 28.6% | 32.4% | 35.7% | 35.5% | 42.1% | 36.6% | 41.9%  | 29.4% | 36.2%  |
| XS           | 52.1%     | 30.3% |       |       | 50.0% | 36.8% | 39.1% | 28.6% | 13.8% |        | 0.0%  | 27.1%  |

# EDA

- There are brands that have more discounts than others
- Some brand sell few SKUs, so percentage might be misleading

# EDA

- Are more expensive products discounted less? More?
- Data shows that the discount percentage tends to increase as price of the product decreases

# Feature Selection

We grouped the dataset by the remaining variables:

- 'brand',
- 'vendor',
- 'dept',
- 'classid',
- 'color'
- 'size'

Resulted in 186410 groups out of the 266225 rows.

# Size Cleaning

- Select out non-numerical size first
- Numerical value of size is inconsistent for different types of items.
- List comprehension to extract only
  - 'ALL', 'L','M','ONE', 'S', 'XL', and 'XS' for size

# Color cleaning

- Define new color system: includes majority of popular colors
  - 13 colors: BLACK, BLUE, WHITE, PINK, RED, MULTI, SILVER, GREEN, NOCOLOR, GOLD, BROWN, YELLOW and OTHER
- Regular expressions to map the current colors to new system. Examples:
  - BLACK, BLAK, 100BLACK → BLACK
  - NAVY, DARKBLUE → BLUE
  - WHITE/PINK → PINK
  - CHOCO → OTHER
- Colors that can't be classified → OTHER

# Modeling

- Decision tree is considered the baseline model ( $R^2 = 28\%$ )
- Our proposed final model has  $R^2 = 48\%$
- Less overfitting issue

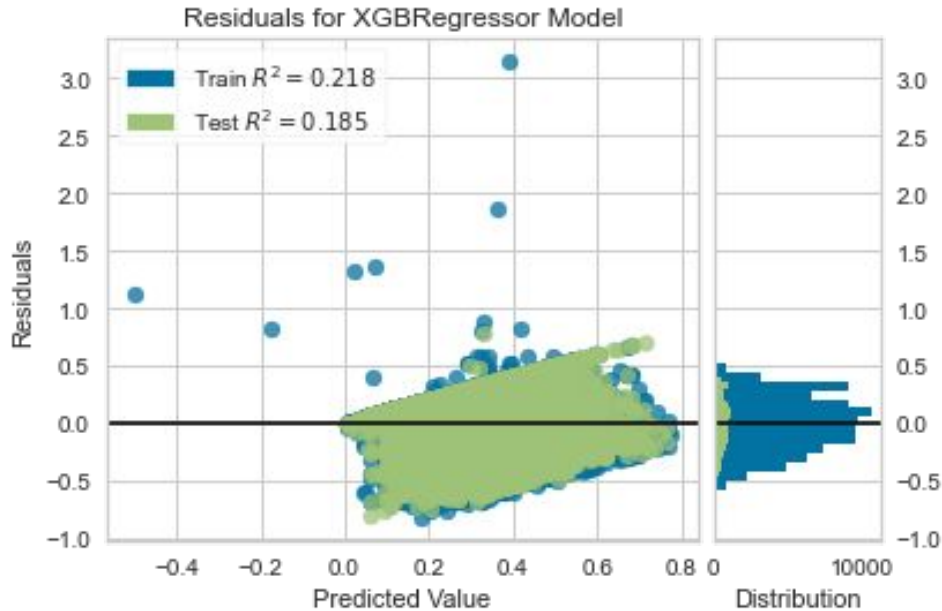

Table 2 Modeling results and hyperparameters

| Model<br>Metrics      | Decision Tree                         | Random Forest                          | XGBoost<br>(base model)<br>XGBRegressor<br>with<br>objective='reg:squareerror' | <b>XGBoost<br/>(final model)**</b><br>XGBRegressor with<br>objective='reg:squareerror'  |

# ROI Analysis

- Assumption
  - Dillard's has limited storage space for inventory → need to choose which products to keep
  - Uses model to choose which products they will not stock and decrease their production rate
  - Proposed model outperforms baseline model → identifies underperforming products better → reduces loss (or reduces profits “left on the table”)
- Details in the spreadsheet

|  |    |                       |                       |               |

| Total profit with proposed model       |    |                       | \$                    | 2,752,581,159 |

# Results and Risks

- Proposed model can identify the products that need discounts better than the baseline model ( $R^2 = 28\%$  vs  $48\%$ )
- This results in more profit for the company: ROI = US\$ 6.8 MM
- Risks
  - Train set performance is still relatively better than test set for the final model ( $58\%$  vs  $48\%$ ), so there are still overfitting issues (although this was largely improved compared to the baseline model)
  - Calculation of ROI is based on the extrapolation of the test set performance to company-level profits. If we had more time/resources, comprehensive tests should be made to ensure we achieve similar results
